

CS70: Discrete Math and Probability

Slides adopted from Satish Rao, CS70 Spring 2016
June 20, 2016

Learning tips

Take homework seriously!
Go to homework parties, study groups
VERY fast paced, start early
Use piazza, help each other out

Questions?

3

Introduction

Programming Computers \equiv Superpower!

What are your super powerful programs doing?
Logic and Proofs!
Induction \equiv Recursion.

What can computers do?
Work with discrete objects.
[Discrete Math](#) \implies immense application.

Computers learn and interact with the world?
E.g. machine learning, data analysis.
[Probability!](#)

See note 1, for more discussion.

Course Webpage: www.eecs70.org

Explains policies, has homework/discussion worksheets, slides, exam dates, etc.

Questions \implies piazza:
piazza.com/berkeley/summer2016/cs70

Assessment:
Homework: 20%
Midterm 1 (07/08): 20%
Midterm 2 (07/29): 20%
Final (08/12): 35%
Quiz: 4%
Sundry: 1%

Conflicts? Piazza pinned post.

2

Fan Ye

Just graduated, from Berkeley

Been TA for CS70 for two semesters

Will start working at Google as a software engineer on September

Enjoy climbing, badminton, boxing, also like to watch movies and games
Recently I'm climbing ... the ladder of league of legends ranking system ...

Office hours: Monday 10-11, Tuesday 11-12 in Soda 611 or by appointment

5

David Dinh

Email: dinh@cs.berkeley.edu
Office Hours: M/W 3:30-5:00 (right after lecture) in 606 Soda
I just finished my first year of grad school. My research interests are numerical algorithms and complexity theory - essentially, I work on making faster algorithms for doing things like solving equations, factoring matrices, etc. (and proving that they run fast!), as well as showing that there are limits on how fast we can make these algorithms.
Also did my undergrad here at Cal - CS70 was by far my favorite lower-div.
Fun fact: I like to make ice cream.

6

Wason's experiment:1

- Suppose we have four cards on a table:
- 1st about Alice, 2nd about Bob, 3rd Charlie, 4th Donna.
 - Card contains person's **destination** on one side, and **mode of travel**.
 - Consider the theory:
"If a person travels to Chicago, he/she flies."
 - Suppose you see that Alice went to Baltimore, Bob drove, Charlie went to Chicago, and Donna flew.
- Alice
Baltimore

Bob
drove

Charlie
Chicago

Donna
flew
- Which cards do you need to flip to test the theory?

Answer: Later.

9

Alex Psomas

Not here today. Tomorrow lecture

7

CS70: Lecture 1. Outline.

- Today: Note 1. Note 0 is background. Do read/skim it.
- The language of proofs!
1. Propositions.
 2. Propositional Forms.
 3. Implication.
 4. Truth Tables
 5. Quantifiers
 6. More De Morgan's Laws

10

Staffs

3 Co-Instructors
12 awesome and talented TAs.

8

Propositions: Statements that are true or false.

$\sqrt{2}$ is irrational	Proposition	True
$2+2 = 4$	Proposition	True
$2+2 = 3$	Proposition	False
826th digit of pi is 4	Proposition	False
Stephen Curry is a good player.	Not a Proposition	
All evens > 2 are sums of 2 primes	Proposition	False
$4 + 5$	Not a Proposition.	
$x + x$	Not a Proposition.	
Alice travelled to Chicago	Proposition.	False

Again: "value" of a proposition is ... True or False

11

Propositional Forms.

Put propositions together to make another...

Conjunction ("and"): $P \wedge Q$

" $P \wedge Q$ " is **True** when both P and Q are **True**. Else **False**.

Disjunction ("or"): $P \vee Q$

" $P \vee Q$ " is **True** when at least one P or Q is **True**. Else **False**.

Negation ("not"): $\neg P$

" $\neg P$ " is **True** when P is **False**. Else **False**.

Examples:

$\neg (2 + 2 = 4)$ – a proposition that is ... **False**

" $2 + 2 = 3$ " \wedge " $2 + 2 = 4$ " – a proposition that is ... **False**

" $2 + 2 = 3$ " \vee " $2 + 2 = 4$ " – a proposition that is ... **True**

12

Truth Tables for Propositional Forms.

P	Q	$P \wedge Q$
T	T	T
T	F	F
F	T	F
F	F	F

P	Q	$P \vee Q$
T	T	T
T	F	T
F	T	T
F	F	F

Notice: \wedge and \vee are commutative.

One use for truth tables: Logical Equivalence of propositional forms!

Example: $\neg(P \wedge Q)$ logically equivalent to $\neg P \vee \neg Q$

...because the two propositional forms have the same...

....Truth Table!

P	Q	$\neg(P \vee Q)$	$\neg P \wedge \neg Q$
T	T	F	F
T	F	F	F
F	T	F	F
F	F	T	T

DeMorgan's Law's for Negation: distribute and flip!

$$\neg(P \wedge Q) \equiv \neg P \vee \neg Q$$

$$\neg(P \vee Q) \equiv \neg P \wedge \neg Q$$

15

Propositional Forms: quick check!

$P = \sqrt{2}$ is rational"

$Q =$ "826th digit of pi is 2"

P is ...**False**.

Q is ...**True**.

$P \wedge Q$... **False**

$P \vee Q$... **True**

$\neg P$... **True**

13

Distributive?

$$P \wedge (Q \vee R) \equiv (P \wedge Q) \vee (P \wedge R)?$$

Simplify: $(T \wedge Q) \equiv Q$, $(F \wedge Q) \equiv F$.

Cases:

P is **True**.

$$\text{LHS: } T \wedge (Q \vee R) \equiv (Q \vee R).$$

$$\text{RHS: } (T \wedge Q) \vee (T \wedge R) \equiv (Q \vee R).$$

P is **False**.

$$\text{LHS: } F \wedge (Q \vee R) \equiv F.$$

$$\text{RHS: } (F \wedge Q) \vee (F \wedge R) \equiv (F \vee F) \equiv F.$$

$$P \vee (Q \wedge R) \equiv (P \vee Q) \wedge (P \vee R)?$$

Simplify: $T \vee Q \equiv T$, $F \vee Q \equiv Q$.

Foil 1:

$$(A \vee B) \wedge (C \vee D) \equiv (A \wedge C) \vee (A \wedge D) \vee (B \wedge C) \vee (B \wedge D)?$$

Foil 2:

$$(A \wedge B) \vee (C \wedge D) \equiv (A \vee C) \wedge (A \vee D) \wedge (B \vee C) \wedge (B \vee D)?$$

16

Put them together..

Propositions:

C_1 - Take class 1

C_2 - Take class 2

....

You can only take one of class 1, class 2 and one of class 3, class 4, or take both class 2, class 3 and take either class 5 or class 6, as long as you are not taking class 4 at the same time.

Propositional Form:

$$((C_1 \vee C_2) \wedge (C_3 \vee C_4)) \vee ((C_2 \wedge C_3) \wedge (C_5 \vee C_6) \wedge (\neg C_4))$$

Can you take class 1?

Can you take class 1 and class 5 together?

This seems ...**complicated**.

We can program!!!! We need a way to keep track!

14

Implication.

$P \implies Q$ interpreted as

If P , then Q .

True Statements: $P, P \implies Q$.

Conclude: Q is true.

Examples:

Statement: If you stand in the rain, then you'll get wet.

$P =$ "you stand in the rain"

$Q =$ "you will get wet"

Statement: "Stand in the rain"

Can conclude: "you'll get wet."

Statement: If a right triangle has sidelengths $a \leq b \leq c$, then $a^2 + b^2 = c^2$.

$P =$ "a right triangle has sidelengths $a \leq b \leq c$ ",

$Q =$ " $a^2 + b^2 = c^2$ ".

17

Non-Consequences/consequences of Implication

The statement " $P \implies Q$ "

only is **False** if P is **True** and Q is **False**.

False implies nothing

P False means Q can be **True** or **False**

Anything implies true.

P can be **True** or **False** when Q is **True**

If chemical plant pollutes river, fish die.

If fish die, did chemical plant pollute river?

Not necessarily.

$P \implies Q$ and Q are **True** does not mean P is **True**

Be careful!!

Instead we have:

$P \implies Q$ and P are **True** does mean Q is **True**.

The chemical plant pollutes river. Can we conclude fish die?

Some Fun: use propositional formulas to describe implication?

$((P \implies Q) \wedge P) \implies Q$.

18

Contrapositive, Converse

- Contrapositive of $P \implies Q$ is $\neg Q \implies \neg P$.

- If the plant pollutes, fish die.

- If the fish don't die, the plant does not pollute.

(contrapositive)

- If you stand in the rain, you get wet.

- If you did not stand in the rain, you did not get wet.

(not contrapositive!) converse!

- If you did not get wet, you did not stand in the rain.

(contrapositive.)

Logically equivalent! Notation: \equiv .

$P \implies Q \equiv \neg P \vee Q \equiv \neg(\neg Q) \vee \neg P \equiv \neg Q \implies \neg P$.

- Converse of $P \implies Q$ is $Q \implies P$.

If fish die the plant pollutes.

Not logically equivalent!

- Definition:** If $P \implies Q$ and $Q \implies P$ is P if and only if Q or $P \iff Q$.

(Logically Equivalent: \iff .)

21

Implication and English.

$P \implies Q$

- If P , then Q .

- Q if P .

Just reversing the order.

- P only if Q .

Remember if P is true then Q must be true.

this suggests that P can only be true if Q is true.

since if Q is false P must have been false.

- P is sufficient for Q .

This means that proving P allows you

to conclude that Q is true.

- Q is necessary for P .

For P to be true it is necessary that Q is true.

Or if Q is false then we know that P is false.

19

Variables.

Propositions?

- $\sum_{i=1}^n i = \frac{n(n+1)}{2}$.

- $x > 2$

- n is even and the sum of two primes

No. They have a free variable.

We call them predicates, e.g., $Q(x) = "x \text{ is even}"$

Same as boolean valued functions from 61A or 61AS!

- $P(n) = "\sum_{i=1}^n i = \frac{n(n+1)}{2}."$

- $R(x) = "x > 2"$

- $G(n) = "n \text{ is even and the sum of two primes}"$

- Remember Wason's experiment!

$F(x) = "Person x \text{ flew}."$

$C(x) = "Person x \text{ went to Chicago}"$

- $C(x) \implies F(x)$. Theory from Wason's.

If person x goes to Chicago then person x flew.

Next: Statements about boolean valued functions!!

22

Truth Table: implication.

P	Q	$P \implies Q$
T	T	T
T	F	F
F	T	T
F	F	T

P	Q	$\neg P \vee Q$
T	T	T
T	F	F
F	T	T
F	F	T

$$\neg P \vee Q \equiv P \implies Q.$$

These two propositional forms are logically equivalent!

20

Quantifiers..

There exists quantifier:

$(\exists x \in S)(P(x))$ means "There exists an x in S where $P(x)$ is true."

For example:

$$(\exists x \in \mathbb{N})(x = x^2)$$

Equivalent to " $(0 = 0) \vee (1 = 1) \vee (2 = 4) \vee \dots$ "

Much shorter to use a quantifier!

For all quantifier;

$(\forall x \in S)(P(x))$. means "For all x in S , we have $P(x)$ is **True**."

Examples:

"Adding 1 makes a bigger number." $(\forall x \in \mathbb{N})(x + 1 > x)$

"the square of a number is always non-negative" $(\forall x \in \mathbb{N})(x^2 \geq 0)$

Wait! What is \mathbb{N} ?

23

Quantifiers: universes.

Proposition: “For all natural numbers n , $\sum_{i=1}^n i = \frac{n(n+1)}{2}$.”

Proposition has **universe**: “the natural numbers”.

Universe examples include..

- $\mathbb{N} = \{0, 1, \dots\}$ (natural numbers).
- $\mathbb{Z} = \{\dots, -1, 0, \dots\}$ (integers)
- \mathbb{Z}^+ (positive integers)
- \mathbb{R} (real numbers)
- Any set: $S = \{Alice, Bob, Charlie, Donna\}$.
- See note 0 for more!

24

Quantifiers..not commutative.

- In English: “there is a natural number that is the square of every natural number”.

$$(\exists y \in \mathbb{N}) (\forall x \in \mathbb{N}) (y = x^2) \quad \text{False}$$

- In English: “the square of every natural number is a natural number.”

$$(\forall x \in \mathbb{N}) (\exists y \in \mathbb{N}) (y = x^2) \quad \text{True}$$

27

Back to: Wason's experiment:1

Theory:

“If a person travels to Chicago, he/she flies.”

Suppose you see that Alice went to Baltimore, Bob drove, Charlie went to Chicago, and Donna flew.

Which cards do you need to flip to test the theory?

$$P(x) = \text{“Person } x \text{ went to Chicago.”} \quad Q(x) = \text{“Person } x \text{ flew”}$$

Statement/theory: $\forall x \in \{A, B, C, D\}, P(x) \implies Q(x)$

$P(A) = \text{False}$. Do we care about $Q(A)$?

No. $P(A) \implies Q(A)$, when $P(A)$ is **False**, $Q(A)$ can be anything.

$Q(B) = \text{False}$. Do we care about $P(B)$?

Yes. $P(B) \implies Q(B) \equiv \neg Q(B) \implies \neg P(B)$.

So $P(Bob)$ must be **False**.

$P(C) = \text{True}$. Do we care about $P(C)$?

Yes. $P(C) \implies Q(C)$ means $Q(C)$ must be true.

$Q(D) = \text{True}$. Do we care about $P(D)$?

No. $P(D) \implies Q(D)$ holds whatever $P(D)$ is when $Q(D)$ is true.

Only have to turn over cards for Bob and Charlie.

25

Quantifiers....negation...DeMorgan again.

Consider

$$\neg(\forall x \in S)(P(x)),$$

English: there is an x in S where $P(x)$ does not hold.

That is,

$$\neg(\forall x \in S)(P(x)) \iff \exists(x \in S)(\neg P(x)).$$

What we do in this course! We consider claims.

Claim: $(\forall x) P(x)$ “For all inputs x the program works.”

For **False**, find x , where $\neg P(x)$.

Counterexample.

Bad input.

Case that illustrates bug.

For **True**: prove claim. Next lectures...

28

More for all quantifiers examples.

- “doubling a natural number always makes it larger”

$$(\forall x \in \mathbb{N}) (2x > x) \quad \text{False Consider } x = 0$$

Can fix statement...

$$(\forall x \in \mathbb{N}) (2x \geq x) \quad \text{True}$$

- “Square of any natural number greater than 5 is greater than 25.”

$$(\forall x \in \mathbb{N}) (x > 5 \implies x^2 > 25).$$

Idea alert: Restrict domain using implication.

Note that we may omit universe if clear from context.

26

Negation of exists.

Consider

$$\neg(\exists x \in S)(P(x))$$

English: means that for all x in S , $P(x)$ does not hold.

That is,

$$\neg(\exists x \in S)(P(x)) \iff \forall(x \in S)\neg P(x).$$

29

Talk logically

Theorem: No three positive integers a, b, c satisfy the equation $a^n + b^n = c^n$ for any integer n strictly larger than two.

Which Theorem?

Fermat's Last Theorem!

How to express this theorem using propositions?

$(\forall n \in \mathbb{N}); \neg(\exists a, b, c \in \mathbb{N})(n \geq 3 \implies a^n + b^n = c^n)$

Using implication to state edge case restrictions (for any integer strictly greater than two)

DeMorgan Restatement:

Theorem: $\neg(\exists n \in \mathbb{N}) (\exists a, b, c \in \mathbb{N}) (n \geq 3 \implies a^n + b^n = c^n)$

30

Summary.

Propositions are statements that are true or false.

Propositional forms use \wedge, \vee, \neg .

Propositional forms correspond to truth tables.

Logical equivalence of forms means same truth tables.

Implication: $P \implies Q \iff \neg P \vee Q$.

Contrapositive: $\neg Q \implies \neg P$

Converse: $Q \implies P$

Predicates: Statements with "free" variables.

Quantifiers: $\forall x P(x), \exists y Q(y)$

Now can state theorems! And disprove false ones!

DeMorgans Laws: "Flip and Distribute negation"

$\neg(P \vee Q) \iff (\neg P \wedge \neg Q)$

$\neg \forall x P(x) \iff \exists x \neg P(x).$

$\neg \exists x P(x) \iff \forall x \neg P(x).$

Next Time: proofs!

31
