 (law of total probability)

Proof:

(b) is obvious.

See next two slides for (a) and (c).

$$Pr[A \cup B] = Pr[A] + Pr[B] - Pr[A \cap B]$$

$$Pr[A \cup B] = Pr[A] + Pr[B] - Pr[A \cap B]$$

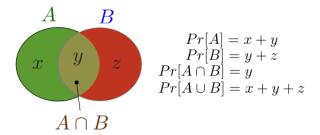

$$Pr[A \cup B] = Pr[A] + Pr[B] - Pr[A \cap B]$$

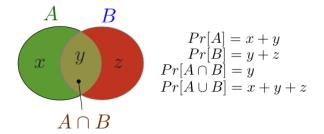

Can I instead say that $|A \cup B| = |A| + |B| - |A \cap B|$?

$$Pr[A \cup B] = Pr[A] + Pr[B] - Pr[A \cap B]$$

Can I instead say that $|A \cup B| = |A| + |B| - |A \cap B|$?

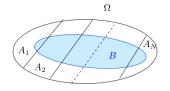

$$Pr[A \cup B] = Pr[A] + Pr[B] - Pr[A \cap B]$$

Can I instead say that $|A \cup B| = |A| + |B| - |A \cap B|$? No! We don't know if the sample space is uniform.

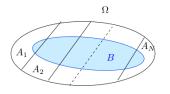

Total probability

Assume that Ω is the union of the disjoint sets A_1, \ldots, A_N .

Total probability

Assume that Ω is the union of the disjoint sets A_1, \dots, A_N .

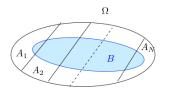

Then,

$$Pr[B] = Pr[A_1 \cap B] + \dots + Pr[A_N \cap B].$$

Total probability

Assume that Ω is the union of the disjoint sets A_1, \dots, A_N .

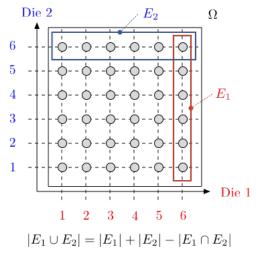

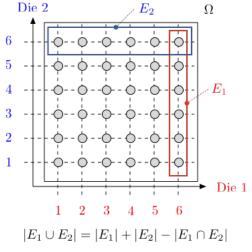

Then,

$$Pr[B] = Pr[A_1 \cap B] + \cdots + Pr[A_N \cap B].$$

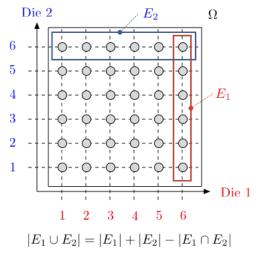

Indeed, *B* is the union of the disjoint sets $A_n \cap B$ for n = 1, ..., N.

```

$$Pr[B|A] = \frac{|B \cap A|}{|A|} = \frac{1}{2}.$$

Same as Pr[B].

The likelihood of 51st heads does not depend on the previous flips.

Recall the definition:

Recall the definition:

$$Pr[B|A] = \frac{Pr[A \cap B]}{Pr[A]}.$$

Recall the definition:

$$Pr[B|A] = \frac{Pr[A \cap B]}{Pr[A]}.$$

Hence,

$$Pr[A \cap B] = Pr[A]Pr[B|A].$$

Recall the definition:

$$Pr[B|A] = \frac{Pr[A \cap B]}{Pr[A]}.$$

Hence,

$$Pr[A \cap B] = Pr[A]Pr[B|A].$$

Consequently,

$$Pr[A \cap B \cap C] = Pr[(A \cap B) \cap C]$$

Recall the definition:

$$Pr[B|A] = \frac{Pr[A \cap B]}{Pr[A]}.$$

Hence,

$$Pr[A \cap B] = Pr[A]Pr[B|A].$$

Consequently,

$$Pr[A \cap B \cap C] = Pr[(A \cap B) \cap C]$$

= $Pr[A \cap B]Pr[C|A \cap B]$

Recall the definition:

$$Pr[B|A] = \frac{Pr[A \cap B]}{Pr[A]}.$$

Hence,

$$Pr[A \cap B] = Pr[A]Pr[B|A].$$

Consequently,

$$Pr[A \cap B \cap C] = Pr[(A \cap B) \cap C]$$

$$= Pr[A \cap B]Pr[C|A \cap B]$$

$$= Pr[A]Pr[B|A]Pr[C|A \cap B].$$

Theorem Product Rule Let $A_1, A_2, ..., A_n$ be events. Then

Theorem Product Rule Let $A_1, A_2, ..., A_n$ be events. Then

Independence and conditional probability

Fact: Two events A and B are independent if and only if

Fact: Two events A and B are independent if and only if

$$Pr[A|B] = Pr[A].$$

Fact: Two events A and B are **independent** if and only if

$$Pr[A|B] = Pr[A].$$

Indeed:

Fact: Two events A and B are **independent** if and only if

$$Pr[A|B] = Pr[A].$$

Indeed: $Pr[A|B] = \frac{Pr[A \cap B]}{Pr[B]}$, so that

Fact: Two events A and B are **independent** if and only if

$$Pr[A|B] = Pr[A].$$

Indeed:
$$Pr[A|B] = \frac{Pr[A \cap B]}{Pr[B]}$$
, so that

$$Pr[A|B] = Pr[A] \Leftrightarrow \frac{Pr[A \cap B]}{Pr[B]} = Pr[A]$$

Fact: Two events A and B are **independent** if and only if

$$Pr[A|B] = Pr[A].$$

Indeed: $Pr[A|B] = \frac{Pr[A \cap B]}{Pr[B]}$, so that

$$Pr[A|B] = Pr[A] \Leftrightarrow \frac{Pr[A \cap B]}{Pr[B]} = Pr[A] \Leftrightarrow Pr[A \cap B] = Pr[A]Pr[B].$$

Your coin is fair w.p. 1/2 or such that Pr[H] = 0.6, otherwise.

Your coin is fair w.p. 1/2 or such that Pr[H] = 0.6, otherwise.

You flip your coin and it yields heads.

Your coin is fair w.p. 1/2 or such that Pr[H] = 0.6, otherwise.

You flip your coin and it yields heads.

What is the probability that it is fair?

Your coin is fair w.p. 1/2 or such that Pr[H] = 0.6, otherwise.

You flip your coin and it yields heads.

What is the probability that it is fair?

Analysis:

Your coin is fair w.p. 1/2 or such that Pr[H] = 0.6, otherwise.

You flip your coin and it yields heads.

What is the probability that it is fair?

Analysis:

A = 'coin is fair',

Your coin is fair w.p. 1/2 or such that Pr[H] = 0.6, otherwise.

You flip your coin and it yields heads.

What is the probability that it is fair?

Analysis:

A = 'coin is fair', B = 'outcome is heads'

Your coin is fair w.p. 1/2 or such that Pr[H] = 0.6, otherwise.

You flip your coin and it yields heads.

What is the probability that it is fair?

Analysis:

A = 'coin is fair', B = 'outcome is heads'

We want to calculate P[A|B].

Your coin is fair w.p. 1/2 or such that Pr[H] = 0.6, otherwise.

You flip your coin and it yields heads.

What is the probability that it is fair?

Analysis:

A = 'coin is fair', B = 'outcome is heads'

We want to calculate P[A|B].

We know P[B|A] =

Your coin is fair w.p. 1/2 or such that Pr[H] = 0.6, otherwise.

You flip your coin and it yields heads.

What is the probability that it is fair?

Analysis:

A = 'coin is fair', B = 'outcome is heads'

We want to calculate P[A|B].

We know $P[B|A] = 1/2, P[B|\bar{A}] =$

Your coin is fair w.p. 1/2 or such that Pr[H] = 0.6, otherwise.

You flip your coin and it yields heads.

What is the probability that it is fair?

Analysis:

A = 'coin is fair', B = 'outcome is heads'

We want to calculate P[A|B].

We know $P[B|A] = 1/2, P[B|\bar{A}] = 0.6,$

Your coin is fair w.p. 1/2 or such that Pr[H] = 0.6, otherwise.

You flip your coin and it yields heads.

What is the probability that it is fair?

Analysis:

A = 'coin is fair', B = 'outcome is heads'

We want to calculate P[A|B].

We know $P[B|A] = 1/2, P[B|\bar{A}] = 0.6, Pr[A] =$

Your coin is fair w.p. 1/2 or such that Pr[H] = 0.6, otherwise.

You flip your coin and it yields heads.

What is the probability that it is fair?

Analysis:

A = 'coin is fair', B = 'outcome is heads'

We want to calculate P[A|B].

We know $P[B|A] = 1/2, P[B|\bar{A}] = 0.6, Pr[A] = 1/2$

Your coin is fair w.p. 1/2 or such that Pr[H] = 0.6, otherwise.

You flip your coin and it yields heads.

What is the probability that it is fair?

Analysis:

A = 'coin is fair', B = 'outcome is heads'

We want to calculate P[A|B].

We know P[B|A] = 1/2, $P[B|\bar{A}] = 0.6$, $Pr[A] = 1/2 = Pr[\bar{A}]$

Your coin is fair w.p. 1/2 or such that Pr[H] = 0.6, otherwise.

You flip your coin and it yields heads.

What is the probability that it is fair?

Analysis:

$$A =$$
 'coin is fair', $B =$ 'outcome is heads'

We want to calculate P[A|B].

We know
$$P[B|A] = 1/2$$
, $P[B|\bar{A}] = 0.6$, $Pr[A] = 1/2 = Pr[\bar{A}]$
Now,

$$Pr[B] = Pr[A \cap B] + Pr[\bar{A} \cap B] =$$

Your coin is fair w.p. 1/2 or such that Pr[H] = 0.6, otherwise.

You flip your coin and it yields heads.

What is the probability that it is fair?

Analysis:

$$A =$$
 'coin is fair', $B =$ 'outcome is heads'

We want to calculate P[A|B].

We know
$$P[B|A] = 1/2$$
, $P[B|\bar{A}] = 0.6$, $Pr[A] = 1/2 = Pr[\bar{A}]$
Now,

$$Pr[B] = Pr[A \cap B] + Pr[\overline{A} \cap B] = Pr[A]Pr[B|A] + Pr[\overline{A}]Pr[B|\overline{A}]$$

Your coin is fair w.p. 1/2 or such that Pr[H] = 0.6, otherwise.

You flip your coin and it yields heads.

What is the probability that it is fair?

Analysis:

$$A =$$
 'coin is fair', $B =$ 'outcome is heads'

We want to calculate P[A|B].

We know P[B|A] = 1/2, $P[B|\bar{A}] = 0.6$, $Pr[A] = 1/2 = Pr[\bar{A}]$ Now,

$$Pr[B] = Pr[A \cap B] + Pr[\bar{A} \cap B] = Pr[A]Pr[B|A] + Pr[\bar{A}]Pr[B|\bar{A}]$$

= $(1/2)(1/2) + (1/2)0.6 = 0.55.$

Your coin is fair w.p. 1/2 or such that Pr[H] = 0.6, otherwise.

You flip your coin and it yields heads.

What is the probability that it is fair?

Analysis:

$$A =$$
 'coin is fair', $B =$ 'outcome is heads'

We want to calculate P[A|B].

We know P[B|A] = 1/2, $P[B|\bar{A}] = 0.6$, $Pr[A] = 1/2 = Pr[\bar{A}]$ Now,

$$Pr[B] = Pr[A \cap B] + Pr[\bar{A} \cap B] = Pr[A]Pr[B|A] + Pr[\bar{A}]Pr[B|\bar{A}]$$

= $(1/2)(1/2) + (1/2)0.6 = 0.55$.

Thus,

$$Pr[A|B] = \frac{Pr[A]Pr[B|A]}{Pr[B]} = \frac{(1/2)(1/2)}{(1/2)(1/2) + (1/2)0.6} \approx 0.45.$$

Is you coin loaded? A picture:

A picture:

fair coin A1/2

1/2

0.6 \bar{A} loaded coin

A picture:

fair coin A1/2

1/2

0.6 \bar{A} loaded coin

Imagine 100 situations, among which m := 100(1/2)(1/2) are such that A and B occur and n := 100(1/2)(0.6) are such that \bar{A} and B occur.

A picture:

fair coin A 1/2 0.6 Aheads

loaded coin

Imagine 100 situations, among which m := 100(1/2)(1/2) are such that A and B occur and n := 100(1/2)(0.6) are such that \bar{A} and B occur.

Thus, among the m+n situations where B occurred, there are m where A occurred.

A picture:

fair coin A1/2

1/2

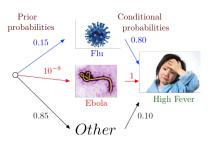

0.6 \overline{A} loaded coin

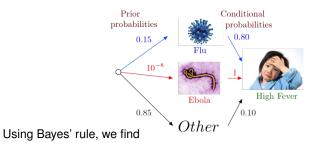

Imagine 100 situations, among which m := 100(1/2)(1/2) are such that A and B occur and n := 100(1/2)(0.6) are such that \bar{A} and B occur.

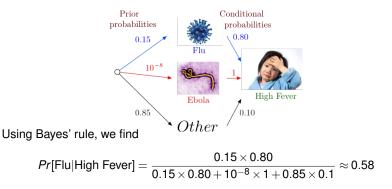

Thus, among the m+n situations where B occurred, there are m where A occurred.

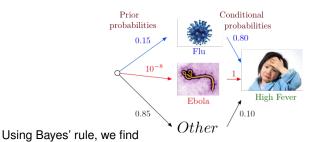

Hence,

$$Pr[A|B] = \frac{m}{m+n} = \frac{(1/2)(1/2)}{(1/2)(1/2) + (1/2)0.6}.$$

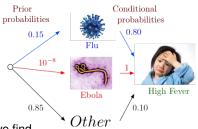

$$Pr[Flu|High Fever] = \frac{0.15 \times 0.80}{0.15 \times 0.80 + 10^{-8} \times 1 + 0.85 \times 0.1}$$

$$Pr[\text{Ebola}|\text{High Fever}] = \frac{10^{-8} \times 1}{0.15 \times 0.80 + 10^{-8} \times 1 + 0.85 \times 0.1} \approx 5 \times 10^{-8}$$

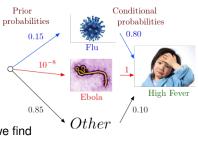

Using Bayes' rule, we find

$$Pr[\text{Flu}|\text{High Fever}] = \frac{0.15 \times 0.80}{0.15 \times 0.80 + 10^{-8} \times 1 + 0.85 \times 0.1} \approx 0.58$$

$$\textit{Pr}[\text{Ebola}|\text{High Fever}] = \frac{10^{-8} \times 1}{0.15 \times 0.80 + 10^{-8} \times 1 + 0.85 \times 0.1} \approx 5 \times 10^{-8}$$

$$Pr[\text{Other}|\text{High Fever}] = \frac{0.85 \times 0.1}{0.15 \times 0.80 + 10^{-8} \times 1 + 0.85 \times 0.1} \approx 0.42$$

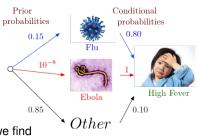

Using Bayes' rule, we find

$$Pr[\text{Flu}|\text{High Fever}] = \frac{0.15 \times 0.80}{0.15 \times 0.80 + 10^{-8} \times 1 + 0.85 \times 0.1} \approx 0.58$$

$$Pr[\text{Ebola}|\text{High Fever}] = \frac{10^{-8} \times 1}{0.15 \times 0.80 + 10^{-8} \times 1 + 0.85 \times 0.1} \approx 5 \times 10^{-8}$$

$$Pr[\text{Other}|\text{High Fever}] = \frac{0.85 \times 0.1}{0.15 \times 0.80 + 10^{-8} \times 1 + 0.85 \times 0.1} \approx 0.42$$

These are the posterior probabilities.

Using Bayes' rule, we find

$$Pr[\text{Flu}|\text{High Fever}] = \frac{0.15 \times 0.80}{0.15 \times 0.80 + 10^{-8} \times 1 + 0.85 \times 0.1} \approx 0.58$$

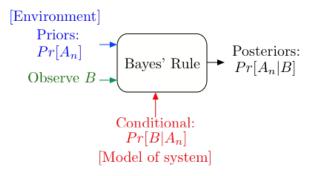

$$Pr[\text{Ebola}|\text{High Fever}] = \frac{10^{-8} \times 1}{0.15 \times 0.80 + 10^{-8} \times 1 + 0.85 \times 0.1} \approx 5 \times 10^{-8}$$

$$\textit{Pr}[\textit{Other}|\textit{High Fever}] = \frac{0.85 \times 0.1}{0.15 \times 0.80 + 10^{-8} \times 1 + 0.85 \times 0.1} \approx 0.42$$

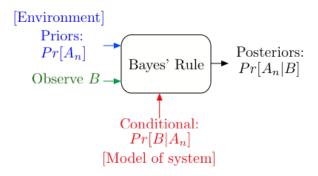

These are the posterior probabilities. One says that 'Flu' is the Most Likely a Posteriori (MAP) cause of the high fever.

Bayes' Rule Operations

Bayes' Rule Operations

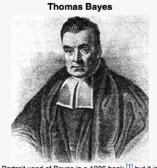

Bayes' Rule Operations

Bayes' Rule is the canonical example of how information changes our opinions.

Thomas Bayes

Portrait used of Bayes in a 1936 book, [1] but it is doubtful whether the portrait is actually of him. [2] No earlier portrait or claimed portrait survives.

Born c. 1701

Died

London, England 7 April 1761 (aged 59)

Tunbridge Wells, Kent, England

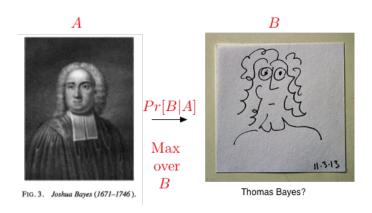

Residence Tunbridge Wells, Kent, England

Nationality English

Known for Bayes' theorem
